

INTER THREAD COMMUNICATION

(1) Story :

> Two threads can communicate with each other by using `wait()`, `notify()` and `notifyAll()` methods

> The thread which is expecting updation is responsible to call `wait ()` method then immediately the thread will enter into waiting state.

> The thread which is responsible to perform updation, after performing updation it is responsible to call `notify` method then waiting thread will get that notification and continue it's execution with those updated item.

WHY `WAIT()`, `NOTIFY ()` , `NOTIFYALL()` METHODS PRESENT IN OBJECT CLASS NOT IN THREAD CLASS?

`Wait`, `notify` , `notifyAll` methods present in object class but not in thread class because thread can call these methods on any java object .

- To call `wait` ,`notify` or `notifyAll` method on any object , thread should be owner of that object that is thread should has lock of that object that is the thread should be inside synchronized area hence , we can call `wait`, `notify` , `notifyAll` method only from synchronized area otherwise we will get run time exception saying ' `illegalMonitorStateException` '
